Dante Network System

• Dante Technology

Based on industry standards, Audinate created Dante, an uncompressed, multi-channel digital media networking technology, with near-zero latency and synchronization. Dante is the preferred audio networking solution that has been adopted by more pro-audio AV manufacturers than any other networking technology. Interoperability is not a dream of the future, but a reality today. Hundreds of Dante-enabled products are available from the world's leading manufacturers, enabling you to mix devices from multiple manufacturers.

• Economical and Versatile

One cable does it all. Dante does away with heavy, expensive analog or multicore cabling, replacing it with low-cost, easily-available CAT5e, CAT6, or fiber optic cable for a simple, lightweight, and economical solution. Dante integrates media and control for your entire system over a single, standard IP network.

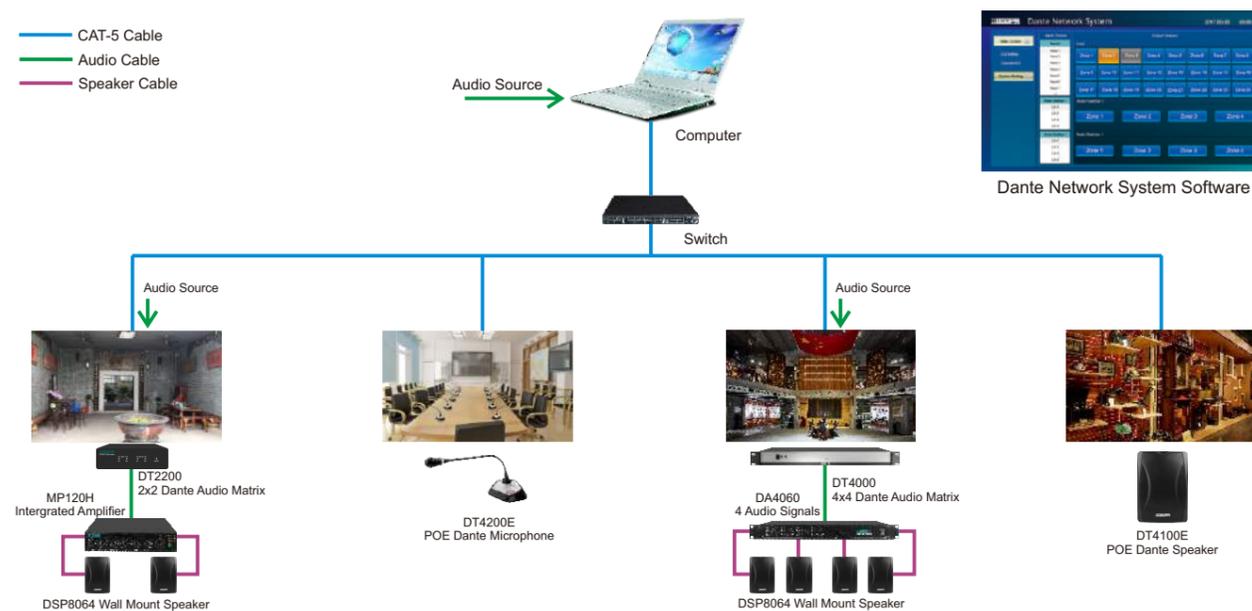

• Outstanding Quality

Since audio is transmitted digitally, you don't have to worry about the common analogue challenges of interference from other electrical equipment, crosstalk between cables, or signal degradation over long cable runs.

• Easy To Install, Easy to Use

Signal routing and system configuration with Dante is fast, simple, and incredibly flexible. Dante Controller is a powerful software application that manages devices on the network. Setting up a Dante network is typically just a matter of plugging devices into an Ethernet switch and connecting a computer to the network. All Dante devices are automatically discovered and displayed in Dante Controller, so you can be up and running in seconds.

With Dante Controller you can easily edit device names and channel labels, control sample rates, and set device latencies. There is no longer any need to remember device IDs or channel numbers.

- The high frequency part adopts wave converter, combined with a British mid-low drive unit with a midrange plug. The treble uses a compression unit with low-distortion titanium composite film. The specially designed high vaulted dome structure increases the strength of the diaphragm and reduces harmonic distortion.
- The bass adopts specially developed dual-voice coil unit. Similar to Class AB amplifier, the push-pull structure reduces the harmonic distortion
- Compared to the structure of the traditional single voice coil, it doubles the heat capacity and voice coil heat radiation area, in order to achieve double power. The two reversed voice coil, can offset the inductance themselves, improve the unit's middle frequency of the bass, while maintaining the strength of bass, reduce low-frequency distortion while expand the low frequency.
- All-aluminum built-in hanger reduces the weight of the box, supporting hanging up to 16 speakers, with 7: 1 safety factor. Up to 8 kinds of hanging installation, extended the use of the speaker.
- LA1408 along with LA1408S make a stacked-type curve array system, to maintain the bass, expand the low frequency while reducing low-frequency distortion. They can increase 35-50Hz band output, and significantly increase the linear stroke.
